SAMMENDRAG

COSIWEB (Computerized Oil Spill Identification) er en internasjonal database som brukes i forbindelse med oljesølidentifikasjon, både for å sammenligne forurensningsprøver med mulige kilder i samme sak, men også med øvrige prøver i databasen.

Databasen har inneholdt svært få norske råoljer og oljeprodukter, men er nå oppdatert med 117 norske råoljer og 6 hybridoljer. COSIWEB er et nyttig screeningverktøy ved et oljesøl og databasen inneholder pr. i dag omlag 3600 oljer og oljeprodukter. Norge har 363 prøver i COSIWEB etter den oppdatering som SINTEF har gjort.

1 Innledning

COSIWEB (Computerized Oil Spill Identification) er en internasjonal database som brukes i forbindelse med oljesølidentifikasjon, både for å sammenligne forurensningsprøver med mulige kilder i samme sak, men også med øvrige prøver i databasen. Databasen har inneholdt svært få norske råoljer og oljeprodukter. Med en oppdatering av COSIWEB med 117 råoljer og 6 hybridoljer, oljer som SINTEF har tilgjengelig på sitt oljelager, har nytteverdien av COSIWEB økt, og man har et bedre grunnlag for å sammenligne ukjente prøver med mulige norske oljer. COSIWEB er et nyttig screeningverktøy ved et oljesøl. Databasen COSIWEB inneholder nå omlag 3600 oljer og oljeprodukter, Norge har 363 prøver i COSIWEB etter den oppdatering som SINTEF har gjort.

Oljeprøvene ble behandlet og analysert som beskrevet i kapittel 5 i CEN (2012) og lastet opp i COSIWEB etter beskrivelse på WEBsidene til Bonn-OSINET og i henhold til gitt konfidensialitet. En kort veiledning i bruk av COSIWEB er gitt i kapittel 3.

2 Prøvebehandling og analyser

Alle prøvene ble behandlet som beskrevet i CEN (2012) kapittel 5, "Sample preparation". Oljeprøvene ble løst i diklormetane (DCM) i en konsentrasjon på 3-7 mg/mL og analysert på gasskromatograf med flammeioniserings detektor (GC/FID) med påfølgende analyse på gasskromatograf med masseselektiv detektor (GC/MS).

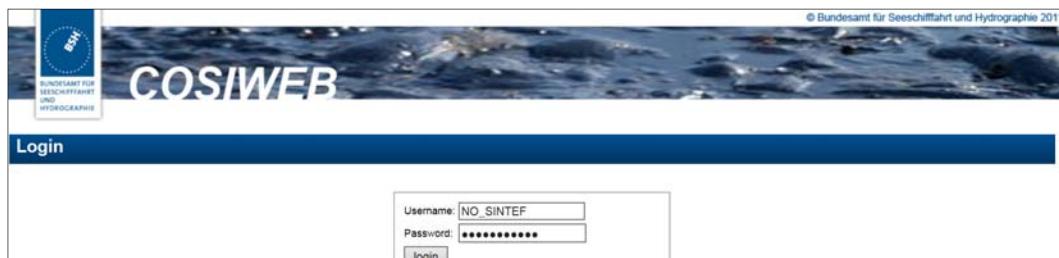

En oversikt over alle prøvene som er lastet opp i COSIWEB er gitt i vedlegg A.

Analysebetingelsene for GC/FID er gitt i CEN (2012) Annex A og for GC/MS i CEN (2012) Annex B.

3 Databasen COSIWEB, bruk og veiledning

COSIWEB er en web-basert database. Den er utviklet i Tyskland ved Bundesamt fur Seeschiffahrt und Hydrographie 2011 (BSH). Alle laboratoriene som er medlemmer i "Oil Spill Identification Network of Experts within the Bonn Agreement" er gitt tilgang til COSIWEB med brukernavn og passord, Figur 3-1. Prøvne og opplysningene som er gitt i COSIWEB skal behandles med konfidensialitet.

COSIWEB er en eldre generasjon database som følger strenge algoritmer for både filtype og navngiving. I COSIWEB gis hver ny identifikasjons-case et nytt casenummer, typisk NOn_+1.

Figur 3-1: Pålogging i COSIWEB

3.1 Karakterisering av GC/FID – nivå 1 og opplasting til COSIWEB

Figur for protokoll/beslutningskart er gitt i Vedlegg E og er fra CEN (2012).

Oljesølidentifikasjon starter med en screeninganalyse på GC/FID. Analysebetingelsene for GC/FID er gitt i CEN2012 Annex A.

Screeninganalysen på GC/FID brukes til å vurdere hvilken oljetype, kokepunktsområde og grad av forvitring. Dersom GC/FID-kromatogrammene viser variasjoner mellom mulige kildeprøver og spillprøver skal man alltid gå videre med analyse av prøvene på GS/MS - nivå 2.

For opplasting av GC/FID-filer til COSIWEB må hver fil først eksporteres til en AIA fil enkeltvis. Dette gjøres enklest ved å opprette en mappe som man f.eks. kan navngi «Case NOn_+1 GC-FID». Når konverteringen er fullført må man gå inn i hver enkelt mappe og gi nytt navn til signalet (typisk bare kalt «signal01»).

Retensjonstiden til pristan og phytan brukes til å normalisere retensjonstidene for alle GC/FID-analysene i databasen og disse skal oppgis ved opplasting av filene til COSIWEB.

3.2 Karakterisering av GC-MS – nivå 2 og opplasting til COSIWEB

Figur for protokoll/beslutningskart er gitt i Vedlegg E.

På nivå 2 skal mistenkte spill- og kildeprøver analyseres på en GC/MS. Analysebetingelsene er gitt i CEN2012 for GC/MS Annex B.

GC/MS-analysene er nødvendige for å utføre en visuell vurdering av utvalgte ionemasser (mz) for å sammenligne prøver og identifisere opplagte likheter og ulikheter mellom prøver i et spiltilfelle.

Ved opplasting av GC/MS-analysen til COSIWEB, utfører COSIWEB ulike statistiske beregninger på utvalgte biomarkører og PAH-analytter ved sammenligning av to prøver.

For at en GC/MS analyse skal kunne lastes opp i COSIWEB, må analyselaboratoriet ha kontroll på analysebetingelsene og være utført i henhold til CEN2012 Annex B. Retensjonstiden for 30ab hopane (mz 191) må være 47,8 minutter og for 3-metyl-fenantren (mz 192) 30,0 minutter.

GC/MS-filene eksporteres til AIA format og navnsettes på samme måte som GC/FID. Det er viktig at man kontrollerer hver enkelt fil før ny navngiving til COSIWEB_ID og opplasting i databasen.

3.3 Prøveidentifisering, verifikasiing og import

Når filene er lastet opp i COSIWEB kan man gå inn i fanen «edit» og inspirerer prøvene og gi en kort beskrivelse som navn på oljen, funnsted eller lignende og SINTEF-ID (Figur 3-2). Det kreves at det legges inn en prøvetakingsdato, oljetype og at det krysses av for at GC/FID og GC/MS har blitt kontrollert og funnet i orden. Deretter går man gjennom en verifikasiing før prøven importeres inn i COSIWEB - databasen. Først da er det mulig å sammenligne prøven med andre prøver i databasen.

Sample	Description	Sampling date	Oil type	GC	MS	Status	Options
No-1-18.200	Eksempel	01.06.2017	crude	2017-08-02	2017-08-02	new	

Figur 3-2: Beskrivelse og verifikasiing av prøven for siste opplasting i COSIWEB

Nå vil man få en rask indikasjon på oljetype og forslag til prøver som matcher. COSIWEB gir en korrelasjons-score på likhet med prøver som ligger i databasen. Man kan velge å sammenligne prøver fra samme case, samme laboratoriet, samme oljetype eller søke i hele databasen (Figur 3-3).

Sample no	Description	Date	Oiltype
No-1-18.39	Goliath crude oil	2001-03-30	crude
No-1-18.40	Glinne crude oil	2001-03-30	crude

Figur 3-3: Valg av parameter ved sammenligning av prøver

4 Resultater

En oversikt over de norske oljene er gitt i Vedlegg A. GC/FID kromatogrammer av disse oljene er vist i Vedlegg B og GC/MS ionelektronikkromatogrammer av hopaner (m/z 191), triaromatiske steraner (m/z 231), C4-fenatrener med retene (m/z 234) og C1-fenantrenere (m/z 192) i Vedlegg C.

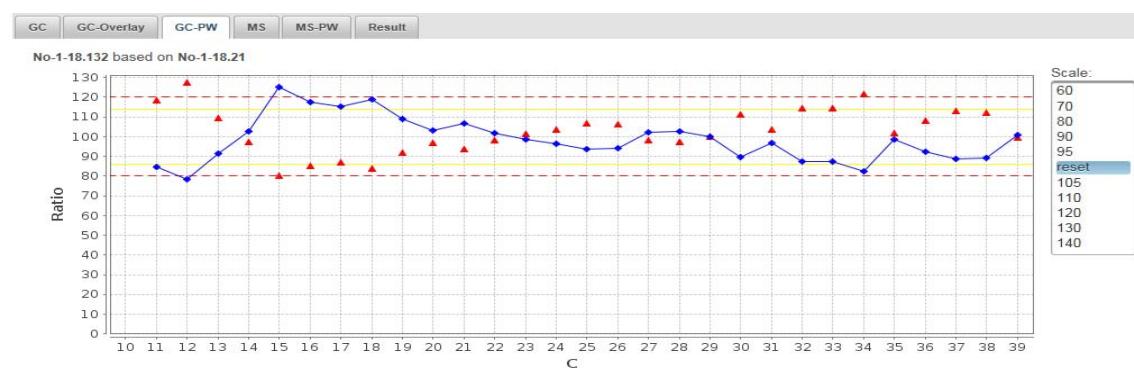

4.1 Vurdering av GC/FID analysen

Ved å velge funksjonene «overlay» kan det gjøres en karakterisering av prøvene, oljetype og grad av forvitring samt en enkel visuell vurdering av likheten. Like viktig; man kan raskt karakterisere opplagte ulikheter mellom to prøver (Figur 4-1).

Figur 4-1: Overlay av GC kromatogram

Ved sammenligning av en kildeprøve og en spillprøve, beregnes et GC-PW-plot, oppgitt i %, basert på responsen til n-alkanene og normalisert mot den gjennomsnittlige responsen til n-C20 til n-C24 (Figur 4-2). Dette kan gi verdifulle informasjoner ved sammenligning av to prøver og gir en indikasjon på om prøvene har forskjellig forvitningsgrad.

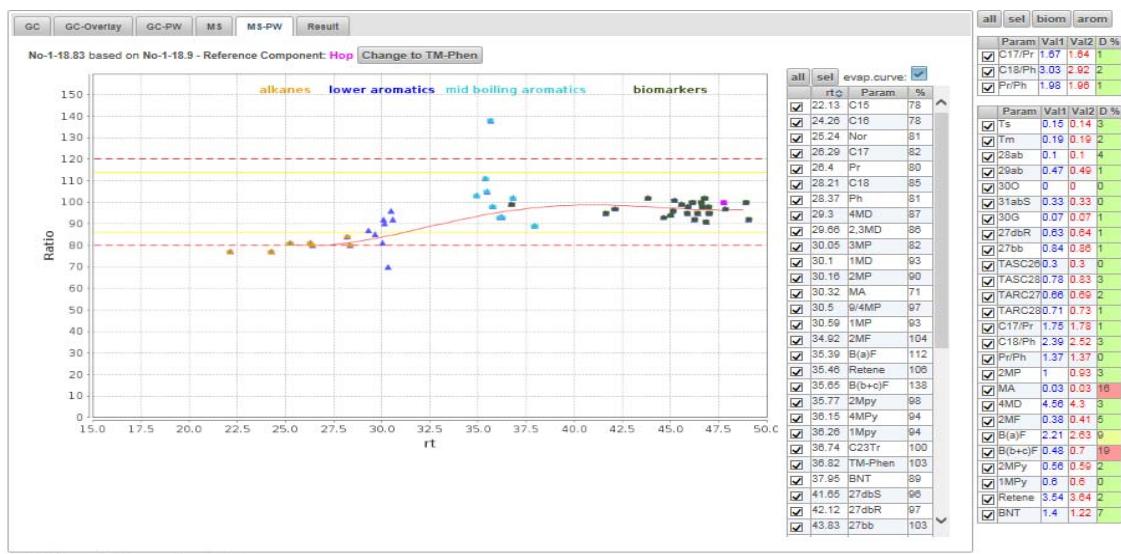

Figur 4-2: GC-PW-plot

4.2 Vurdering av GC/MS analysen

Responsen til utvalgte PAH'er og biomarkører benyttes til å beregne forholdstall som beskrevet i CEN (2012), kapittel 6.4 og 6.5. COSIWEB gir en tabell med en relativ forskjell i %. For at en spillprøve skal ha match med en kildeprøve, må den relative forskjellen i % være mindre enn 14%. Det gir en god visuell indikasjon på likhet i tillegg til å vurdere korrelasjons-scoren som COSIWEB oppgir (Figur 4-3). Like viktig er det å utføre en visuell vurdering av alle ionekromatogrammene av PAH'er og biomarkører og å karakterisere opplagte ulikheter og likheter.

MS-PW-plott og en tabell over forholdstall for sammenligning av prøver er et godt hjelpemiddel ved vurdering om en spillprøve har *positive match* eller *non-match* til en kildeprøve. Man kan fort se åpenbare forskjeller og likheter i typer forvitring og komponentsammensetning.

Figur 4-3: PW plot og tabell over forholdstall fra COSIWEB

4.3 Rapport fra COSIWEB

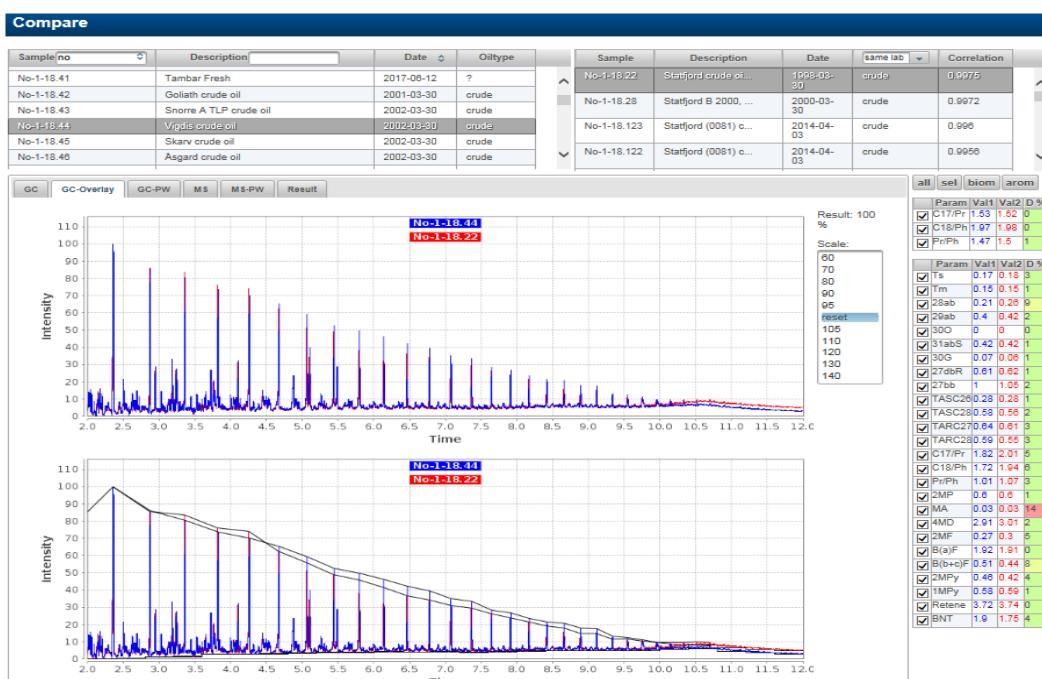

COSIWEB har en rapportgenerator som genererer en rapport av de prøvene som er lastet opp for sammenligning. Eksempel på en "COSI (Computerized Oil Spill Identification) Report" ved sammenligning av råoljene Vigdis vs. Statfjord er gitt i Vedlegg D.

Rapporten sikrer at alle viktige parametere er tatt med i vurderingen slik at man på et vitenskapelig grunnlag skal kunne trekke en konklusjon om en kildeprøve og en spillprøve er "Non-match, Inconclusive, Probable match eller Positive match".

5 Oppsummering

COSIWEB er med dette bidraget blitt et mer nyttig verktøy ved identifisering av oljeutsipp av norske råoljer i norske farvann, men også i tilfeller med uhell ved frakt av råolje fra norsk sokkel i andre deler av verden.

COSIWEB er et screening verktøy og resultater fra databasen må sammenlignes med opplysninger fra scenariet rundt et utsipp. Som vist i figur 5-1 konkluderer COSIWEB med at råolje fra Vigdis-feltet viser positive match med råolje fra Statfjord. GC/FID-kromatogrammene viser identitet, men opplysninger om prøvetaking og funn må vurderes sammen med den tekniske analysen.

Figur 5-1: Søk på match med Vigdis

For å kunne trekke en konklusjon er det en forutsetning med lang erfaring og kompetanse på olje og dens ulike egenskaper. Det viktigste er den visuelle inspeksjonen, forståelse og vurdering som laboratoriepersonell og analytikere utfører i sammenstilling av alle relevante data for å trekke en konklusjon i et reelt oljeutslippsuhell.

Summen av alle opplysninger fra COSIWEB og manuell vurdering gjør at vi på et sikkert grunnlag kan konkludere etter CEN (2012) med "Non-match, Inconclusive, Probable match eller Positive match".

Mass chromatogram

Comment

Part A: Comparison of different samples

For the comparison of a duplicate injection of one of the samples, see part B

GC

Visual inspection, overlays

Oil type (tentative)?

Obvious differences?

Isoprenoid ratios, GC-PW plots

Significant differences?

MS

Visual inspection of the ion chromatograms (MS-tab)

Oil type?

Obvious differences?

Peaks measurements

Reasons for selecting/deselecting DRs and data points in the PW-plots

MS-PW plot -significant differences.

Diagnostic Ratios -significant differences?

Overall Result

Uniqueness of the samples relative to the other samples in the database.

Match conclusion (Match, Possible match, Inconclusive or Non-match)

Part B: Comparison of a duplicate injection of one of
the samples For the comparison of different samples
see part A

GC-FID

Visual inspection, overlays

Obvious differences?

Isoprenoid ratios, GC-PW plots obvious differences.

GC-MS (sim)

Differences of DRs below repeatability?

Differences of PW-plot points below repeatability?

Conclusion

E Vedlegg E: Protokoll/beslutningskart for oljesølidentifikasjon

Figuren er hentet fra CEN (2012).
